

**IN THE CLAIMS:**

Claim 1 (currently amended) A semiconductor device, comprising:  
an I/O region formed on a chip and having at least an input/output pad;  
a plurality of active regions formed on said chip, said active regions being separated from one another by a boundary region;  
a plurality of logic circuits having either one of the same functions and different functions being mounted in each of said active regions, and  
a selection circuit for selectively operating only one of said plurality of mounted logic circuits;  
wherein each of said plurality of mounted logic circuits is operated by setting an SEL signal for selectively turning on/off a plurality of transistor on and off for each of said mounted logic circuits, to one of a high and a low level.

Claim 2 (currently amended) The A semiconductor device comprising:  
an I/O region formed on a chip and having at least an input/output pad;  
an active region formed on said chip;  
a plurality of logic circuits having either one of the same functions and different functions being mounted in said active region, and  
a selection circuit for selectively operating only one of said plurality of mounted logic circuits;  
wherein said selection circuit includes a buffer circuit having a disconnecting section, and said buffer circuit being substantially free of transistors and inverters, and said disconnecting section is being disconnected to allow permanent setting of an operable circuit.

Claim 3 (original) The semiconductor device according to claim 2, wherein said disconnecting section includes a fuse.

Claim 4 (currently amended) The semiconductor device according to claim 1, wherein said selection circuit selects a logic circuit to be operated on a basis of a signal input supplied ~~from an outside~~ through said input/output pad.

Claim 5 (currently amended) The A semiconductor device comprising:  
an I/O region formed on a chip and having at least an input/output pad;

an active region formed on said chip;

a plurality of logic circuits having either one of the same functions and different functions being mounted in said active region, and

a selection circuit for selectively operating only one of said plurality of mounted logic circuits;

wherein said selection circuit includes a transistor element connected in series with each said logic circuit between said logic circuit and a power terminal, and

said transistor element selects a logic circuit to be operated on a basis of a signal input supplied ~~from an outside~~ through said input/output pad.
